## 3.5 Solving quadratic equations – Practice exercises

Formula referenced in the worksheets:

QUADRATIC FORMULA: The equation  $aT^2 + bT + c = 0$  has solutions

$$T = \frac{-b}{2a} \pm \frac{\sqrt{b^2 - 4ac}}{2a}$$

1. A high-jumper jumps so that the height,  $H$  feet, of the point on his back that must clear the bar after  $T$  seconds is given by the equation

$$H = 3.5 + 16T - 16T^2$$

- (a) When would the high-jumper hit the ground (if there were no pit)? Ouch! Use the QUADRATIC FORMULA to find the answer. Use the graph to check.

$$3.5 + 16T - 16T^2 = 0 \Rightarrow -16T^2 + 16T + 3.5 = 0$$

$a = -16 \quad b = 16 \quad c = 3.5$

$$\frac{-b}{2a} = \frac{-16}{2 \times -16} = \frac{-16}{-32} = (-)16 \div (-)32 = .5$$

$16x^2 - 4x(-)16 \times 3.5 = 480$

$$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{16^2 - 4 \times -16 \times 3.5}}{2 \times -16} = \frac{\sqrt{480}}{-32} \approx -.68465$$

$\sqrt{ANS} \div (-)32$

$$T = .5 \pm -.68465$$

$.5 - .68465 = -.18465$   
 $.5 + .68465 = 1.18465 \text{ seconds} \checkmark$

The problem continues ...

$$\swarrow H=2$$

- (b) The high jump pit is 2 feet off the ground. When does the high-jumper land in the pit? Use the QUADRATIC FORMULA to find the answer and the graph to check.

$$3.5 + 16T - 16T^2 = \underset{\text{new}}{2} \Rightarrow -16T^2 + 16T + \underset{-2}{3.5} = \underset{-2}{2}$$

$$-16T^2 + 16T + 1.5 = 0$$

$$a = -16 \quad b = 16 \quad c = 1.5 \text{ NEW!}$$

$$\frac{-b}{2a} = \frac{-16}{2 \times -16} = \frac{-16}{-32} = (-)16 \div (-)32 = .5$$

$$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{16^2 - 4 \times (-16) \times 1.5}}{2 \times -16} = \frac{\sqrt{352}}{-32} \approx -0.5863...$$

$16^2 - 4 \times (-)16 \times 1.5 = 352$   
 $\sqrt{\text{ANS}} \div (-)32 =$

$$T = .5 \pm 0.5863 \begin{cases} \rightarrow .5 - 0.5863 = -0.0863 \\ \rightarrow .5 + 0.5863 = \boxed{1.0863 \text{ seconds}} \checkmark \end{cases}$$

- (c) How high a bar can the high-jumper clear? Find the maximum height of that point above ground by evaluating at  $T = \frac{-b}{2a}$ . Use the graph to check.

$$T = \frac{-b}{2a} = .5, \text{ as before}$$

T	.5
H	7.5

$$3.5 + 16 \times .5 - 16 \times .5^2 = 7.5$$

7.5 feet

7'6"

2. The art museum opened in 1920. After an initial rush to see the great holdings, attendance dropped for awhile. But then attendance began to rise again and has risen since. The number of annual visits  $N$  is approximated by the equation

$$N = 51Y^2 - 840Y + 3,700$$

where  $Y$  is the year since 1920.

- (a) Calculate the missing values in the table.

oops! →

year	1920	1925	1930	1935	1940	1945	1950
$Y$	0	5	10	15	20	25	30
$N$	3,700	775	400	2,575	7,300	14,575	24,400

- (b) Draw a graph of the function.

- (c) In what year did the number of visitors first pass 30,000 in a year? Estimate the value from your graph. Then set up and solve a quadratic equation.

$\approx 32 \text{ years} \Rightarrow 1920 + 32 = \boxed{1952}$   $N = 30,000$

$$51Y^2 - 840Y + 3,700 = 30,000$$

$$\begin{array}{r} 51Y^2 - 840Y + 3,700 \\ -30,000 \quad -30,000 \\ \hline 51Y^2 - 840Y - 26,300 = 0 \end{array}$$

$$51Y^2 - 840Y - 26,300 = 0$$

$$a = 51 \quad b = -840 \quad c = -26,300$$

$$\frac{-b}{2a} = \frac{-(-840)}{2(51)} = \frac{840}{102} \approx 8.2353$$

$$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{(-840)^2 - 4 \times 51 \times -26,300}}{2(51)}$$

$$= \frac{\sqrt{6,070,800}}{102} \approx 24.1559$$

$$8.2353 - 24.1559 = -15.9206$$

$$8.2353 + 24.1559 = 32.3912$$

$\approx 32 \text{ year} \Rightarrow \boxed{1952}$

calculator:

$$\frac{-(-840)}{2 \times 51} = (-X)840 \div (2 \times 51) =$$

$$\text{OR} = \frac{840}{102} = 840 \div 102 =$$

ANSWER 8.2353

calculator:

$$(-840)^2 - 4 \times 51 \times 26,300$$

$$(-840)^2 - 4 \times 51 \times (-26,300) =$$

ANSWER 6,070,800

then:  $\sqrt{\text{ANS}} \div 102 =$

ANSWER 24.1559

The problem continues ...

- (d) According to this equation, in what year was the number of annual visits the smallest? For that year, what were the number of visits? Use  $T = \frac{-b}{2a}$ .

$$Y = \frac{-b}{2a} = 8.2353, \text{ as before.}$$

Y		8.2353	← $51 \times 8.2353^2 - 840 \times 8.2353 + 3700 =$
N		241.17...	

$\approx 241 \text{ visitors}$

- (e) Explain why  $N$  never equals 0.

Smallest is 241.

- (f) So, what actually happens when you try to use the QUADRATIC FORMULA to solve for  $N = 0$ ?

$$51Y^2 - 840Y + 3700 = 0$$

$\underbrace{51}_{a=51} \quad \underbrace{-840}_{b=-840} \quad \underbrace{+3700}_{c=3700}$

$$\frac{-b}{2a} = \frac{-(-840)}{2 \times 51} = \frac{840}{102} = 8.2353, \text{ as before.}$$

$$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{(-840)^2 - 4 \times 51 \times 3700}}{2 \times 51} = \frac{\sqrt{\quad}}{102}$$

$\swarrow$  -49,200  
**ERROR!!**

Square root of negative  $\Rightarrow$  no solution.

3. The profit  $\$P$  from selling  $M$  tanks of milk is described by the equation

$$P = -2M^2 + 2,000M - 80,000$$

- (a) The graph is drawn below. Explain why negative numbers make sense.

You can lose \$.

- (b) How much milk must be sold for the company to **break even**, meaning having \$0 profit? Guess from the graph and check using the equation.

guess  $\approx 45$  tanks

M	45	42	41
$-2 \times 45^2 + 2000 \times 45 - 80,000$	5,950	472	-1362

- (c) For practice, set up and solve a quadratic equation to find the break even point.

$$-2M^2 + 2,000M - 80,000 = 0$$

$a = -2 \quad b = 2000 \quad c = -80,000$

$$\frac{-b}{2a} = \frac{-2000}{2(-2)} = \frac{-2000}{-4} = 500$$

$$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{2000^2 - 4 \times -2 \times -80,000}}{2 \times -2} = \frac{\sqrt{3,360,000}}{-4} = -458.257... \approx -458.3$$

$$M = 500 \pm 458.3$$

$\rightarrow 500 - 458.3 = 41.7 \Rightarrow \boxed{\approx 42 \text{ tanks}}$   
 $\rightarrow 500 + 458.3 = 958.3$

The problem continues ...

- (d) How many tanks of milk would they need to sell to keep profits over \$400,000?  
Set up and solve a quadratic equation to find the answer. Then check that it agrees with your graph. Your answer should be in the form of an inequality.

$$\swarrow P = 400,000$$

$$-2M^2 + 2,000M - 80,000 = 400,000$$

$$\quad \quad \quad -400,000 \quad -400,000$$

$$-2M^2 + 2,000M - 480,000 = 0$$

$$a = -2 \quad b = 2,000 \quad c = -480,000 \text{ New!}$$

$$\frac{-b}{2a} = \frac{-2,000}{2 \times -2} = 500, \text{ as before}$$

$$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{2,000^2 - 4 \times -2 \times -480,000}}{2 \times -2} = \frac{\sqrt{160,000}}{-4} = -100$$

$$M = 500 \pm 100 \begin{cases} \rightarrow 500 - 100 = 400 \\ \rightarrow 500 + 100 = 600 \end{cases}$$

$$\boxed{400 \leq M \leq 600} \text{ between 400 and 600 tanks of milk.}$$

4. Urban community gardens are catching on. What was once an abandoned lot down the block is now a thriving  $10' \times 25'$  vegetable and berry garden for the neighborhood. One neighbor volunteered to donate gravel to make a path around the garden. The path will be 3 inches deep and the same width all around.

The amount of gravel we need ( $G$  cubic feet) is given by the equation

$$G = W^2 + 17.5W$$

where  $W$  is the width of the path in feet. For example, a path 4 feet wide requires 86 cubic feet of gravel, as you can check. *Story also appears in 2.3 and 2.4 Exercises*

- (a) If the neighbor donates 60 cubic feet of gravel, how wide a path can they build? Set up and solve a quadratic equation to find the answer to two decimal places in feet. Then convert your answer into inches.

$W^2 + 17.5W = 60$   
 $W^2 + 17.5W - 60 = 0$   
 $a=1 \quad b=17.5 \quad c=-60$

$-\frac{b}{2a} = \frac{-17.5}{2 \times 1} = -8.75$

$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{17.5^2 - 4 \times 1 \times -60}}{2 \times 1} = \frac{\sqrt{546.25}}{2}$   
 $\approx 11.6859 \dots \approx 11.69$

$W = -8.75 \pm 11.69$   
 $-8.75 - 11.69 = -20.44$   
 $-8.75 + 11.69 = 2.94 \text{ feet} = 2' 11"$

- (b) Gravel is measured by the yard, which is short for cubic yard. There are 27 cubic feet in 1 cubic yard. If the neighbor donates three yards of gravel, how wide a path can they build? Set up and solve a quadratic equation to find the answer to two decimal places in feet. Then convert your answer into inches.

$3 \text{ yards} \times \frac{27 \text{ cuft}}{1 \text{ yard}} = 81 \text{ cuft} \Rightarrow G = 81$

$W^2 + 17.5W = 81$   
 $W^2 + 17.5W - 81 = 0$   
 $a=1 \quad b=17.5 \quad c=-81 \text{ NEW!}$

$-\frac{b}{2a} = \frac{-17.5}{2 \times 1} = -8.75, \text{ as before}$

$\frac{\sqrt{b^2 - 4ac}}{2a} = \frac{\sqrt{17.5^2 - 4 \times 1 \times -81}}{2 \times 1} = \frac{\sqrt{630.25}}{2}$   
 $\approx 12.5523 \approx 12.55$

- (c) What would it mean to solve the equation to find where  $G = 0$ ? Can you tell what the answer is from the equation (without actually solving)?

$W = 0$  No gravel, no path ☺

0 inches

$W = -8.75 \pm 12.55$

$-8.75 - 12.55 = -21.3$

$-8.75 + 12.55 = 3.8 \text{ feet}$

$= 2' 10"$

$.8 \text{ feet} \times \frac{12 \text{ inches}}{1 \text{ foot}} = 9.6 \text{ inches} \approx 10 \text{ inches}$

$.94 \text{ feet} \times \frac{12 \text{ inches}}{1 \text{ foot}} = .94 \times 12 = 11.28 \approx 11 \text{ inches}$
