4.3 Intercepts and direct proportionality – Practice exercises

1. Each of the two stories, below, involve how temperature changes over time. It might be confusing to call either variable T , so use H for the time in hours and D for the temperature in degrees ($^{\circ}\text{F}$). In each case, time should be measured from the start of the story.

- (a) It was really cold at 8:30 this morning when Raina arrived at the office. Luckily the heating system warms things up very quickly, 4°F per hour. By 11:00 a.m. it was a very comfortable 72°F .

- i. Figure out what the temperature was at 8:30 a.m.

$$\begin{array}{r} 11:00 \text{ a.m.} \\ - 8:30 \text{ a.m.} \\ \hline 2:30 \text{ hrs} \\ = 2 \text{ hrs, } 30 \text{ min} \\ = 2.5 \text{ hours} \end{array}$$

$$30 \text{ min} \times \frac{1 \text{ hour}}{60 \text{ min}} = 30 \div 60 = .5 \text{ hr}$$

$$\text{start} + 4^{\circ}\text{F/hr} \times 2.5 \text{ hrs} = 72^{\circ}\text{F}$$

$$4 \times 2.5 = 10^{\circ}\text{F}$$

$$72^{\circ}\text{F} - 10^{\circ}\text{F} = 62^{\circ}\text{F}$$

$$\Rightarrow \text{It was } 62^{\circ}\text{F at } 8:30 \text{ a.m.}$$

OR $\text{start} = \text{dep} - \text{slope} \times \text{indep}$
 $= 72 - 4 \times 2.5 = 62^{\circ}\text{F}$

ii. Write an equation illustrating the function.

$H = \text{time (hours since } 8:30 \text{ a.m.)} \sim \text{indep}$
 $D = \text{temperature of Raina's office } (^{\circ}\text{F}) \sim \text{dep}$

$$D = 62 + 4H$$

don't forget to identify when H starts

since H starts at 8:30 a.m., starting temp is 62°F

- (b) While 72°F is a perfectly good temperature for an office, not so for ballroom dancing. When Raina arrived for her practice at 5:30 that evening, she began to sweat before she even took the floor. Turns out the air conditioner had been running since 4:00 p.m. but it only cools down the room 3°F per hour.

- i. Figure out what the temperature was at 4:00 p.m.

$$\begin{array}{r} 5:30 \text{ p.m.} \\ - 4:00 \text{ p.m.} \\ \hline 1:30 \text{ hrs} \\ = 1 \text{ hr, } 30 \text{ min} \\ = 1.5 \text{ hours} \end{array}$$

$$\text{start} - 3^{\circ}\text{F/hr} \times 1.5 \text{ hrs} = 72^{\circ}\text{F}$$

$$-4.5^{\circ}\text{F}$$

$$72^{\circ}\text{F} + 4.5^{\circ}\text{F} = 76.5^{\circ}\text{F}$$

$$\Rightarrow \text{It was } 76.5^{\circ}\text{F at } 4:00 \text{ p.m.}$$

OR $\text{start} = \text{dep} - \text{slope} \times \text{indep}$
 $= 72 - (-3) \times 1.5 = 76.5^{\circ}\text{F}$

ii. Write an equation illustrating the function.

$H = \text{time (since } 4:00 \text{ p.m.)} \sim \text{indep}$
 $D = \text{temperature of dance studio } (^{\circ}\text{F}) \sim \text{dep}$

$$D = 76.5 - 3H$$

slope is negative because studio is dropping in temperature

2. Maryn is very happy. Her interior design business is finally showing a profit. She has logged a total of 471 billable hours at \$35 per hour since she started her business. Accounting for start up costs, her net profit is totals \$2,194.

- (a) What were Maryn's start up costs?

$$\text{start} + \underbrace{\$35/\text{hr} \times 471 \text{ hrs}}_{\$16,405} = \$2,194$$

$$\Rightarrow \text{start} = 2,194 - 16,405 = \boxed{\$14,291}$$

OR $\text{start} = \text{dep} - \text{slope} \times \text{indep}$
 $= 2194 - 35 \times 471$
 $= -14,291 \checkmark$

- (b) Identify the slope and intercept (including their units and sign) and explain what each means in terms of the story.

intercept = $-14,291$ represents the initial loss because of the start up costs
 slope = $\$35/\text{hr}$ represents the rate Maryn's bills for her work.

- (c) Calculate what Maryn's profits will be once she has logged a total of 1,000 hours.

$$\$35/\text{hr} \times 1000 \text{ hrs} - \$14,291 = 35 \times 1000 - 14,291 = \boxed{\$20,709}$$

- (d) Name the variables and write an equation relating them.

P = Maryn's profit (\$) ~ dep

B = time she bills (hours) ~ indep

$$\boxed{P = 35B - 14,291}$$

the equation can also be written $P = -14,291 + 35B$

- (e) Graph the function.

Summary of info:

B	0	471	1000
P	-14,291	2,194	20,709
	from (a)	from story	from (c)

** initial weight = end weight \pm slope \times # weeks*

4.3. INTERCEPTS AND DIRECT PROPORTIONALITY - PRACTICE EXERCISES

129

3. For each story, find the initial weight of the person and use it to write an equation showing how the person's weight P pounds depends on the time, W weeks.

- (a) Jerome has gained weight since he took his power training to the next level ten weeks ago, at the rate of around 1 pound a week. He now weighs 198 pounds.

$$\text{initial weight} = 198 - \underbrace{1 \times 10}_{10} = 188 \text{ pounds}$$

$$P = 188 + 1W \quad \text{or just } P = 188 + W$$

- (b) Vanessa's doctor put her on a sensible diet and exercise plan to get her back to a healthy weight. She will need to lose an average of 1.25 pounds a week to reach her goal weight of 148 pounds in a year. Use 1 year = 52 weeks.

$$\text{initial weight} = 148 + \underbrace{1.25 \times 52}_{65} = 213 \text{ pounds}$$

$$P = 213 - 1.25W$$

- (c) After the past 6 weeks of terrible migraine headaches, Carlos is down to 158 pounds. He's lost 4 pounds a week.

$$\text{initial weight} = 158 + \underbrace{4 \times 6}_{24} = 182 \text{ pounds}$$

$$P = 182 - 4W$$

- (d) Since she's been pregnant, Zoe has gained the recommended $\frac{1}{2}$ pound per week. Now 30 weeks pregnant and 168 pounds, she wonders if she'll ever see her feet again.

$$\text{initial weight} = 168 - \underbrace{\frac{1}{2} \times 30}_{15} = 153 \text{ pounds}$$

$$P = 153 + .5W$$

$$\frac{1}{2} = 1 \div 2 = .5 \quad \text{ü}$$

4. Each story describes a situation that we are assuming is linear. Decide whether it is **proportional**, meaning the intercept equals zero. If it is not proportional, explain what the intercept would mean in the story.

- (a) The price of kiwis depends on how many kiwis you buy. *Kiwi is a fruit.*

$$\text{Cost} = \# \text{ kiwis} \times \$/\text{kiwi} \Rightarrow \text{no fixed cost}$$

proportional

- (b) The price of a bag of tortillas depends on how many tortillas are in the bag.

some economy of scale 100-tortilla bag
much less than 5 of 20-tortilla bags.

not

- (c) The time it takes to vacuum a rug depends on the area of the rug.

intercept = time to get out / return vacuum

not

- (d) The time it takes to wash dishes depends on how many dirty dishes there are.

no start-up time

proportional

- (e) The amount of laundry detergent I have left depends on how many loads of laundry I did.

$$\text{amount left} = \text{starting amount} - \frac{\text{detergent}}{\text{load}} \times \# \text{ loads}$$

↑
intercept

not
